Researchers deposit data and other research outputs in a repository. Researchers cite data and other research outputs in publication reference lists using DataCite DOIs. These are captured in publication DOI metadata. The researcher or the repository updates the DataCite metadata and includes the DOI of the related publication. Researchers discover data and other research outputs. Citation metrics are harvested and made available and allow researchers, repositories, institutions and funders to gain insight. Connections between DOIs are collected and stored in Event Data. Connections between DOIs are findable in discovery systems like DataCite Commons.
