What is metadata?

Data that provides information about something else

“Data about data”, but not the content of the data

Metadata helps us understand the structure, nature, and context of the data

How can we benefit more?

Let's make metadata:

- Complete: Quantity and quality
- Dynamic: Create and *update* metadata
- Connected: Include PIDs for interoperability

What can we do with better metadata?

Today's presentations:

- FAIR Workflows
 - Xiaoli Chen, FAIR Workflows Project Lead
- IGSN-DataCite Partnership
 - Cody Ross, Application Support Engineer
- NFDI4Ing
 - Paul Vierkant, Outreach Manager

Responsibility for metadata

Four questions:

- Who should be responsible for creating metadata?
- Who is actually responsible for creating metadata?
- Who should be responsible for enriching metadata?
- Who is actually responsible for enriching metadata?
